

Gennux eW@LL Mail 8.27.21 is available - The Global e-Messaging Defence System

Gennux Microsystems Corp., February 24, 2005

URL: <http://www.pr9.net/business/telecom/1511february.html>

Gennux has released eW@LL Mail version 8.27.21. This minor update version of eW@LL MAIL contains primarily support improvements for ISP's, Telco's and ASP's. The new released product is scalable to protect up to 24 million email domains with each of the 24 million domains containing a maximum of 24 million email addresses on a single instance of eW@LL MAIL.

PR9.NET February 24, 2005 - Service Providers find this to be extremely attractive since they can now partition the eW@LL Solution's protection for not only their Consumer Client Base but also all of their Corporate Clients with a single instance of the eW@LL Solution. It facilitates the unprecedented growth capabilities to become a major player in the mission to eradicate the menace of Spam.

Other added features of eW@LL 8.27.21 include:

- Corporate global "Departed List" for departed staff members
- Auto notifications when a message arrives in a "Pending" folder
- "On-the-fly" user help instructions
- Monthly Spam statistics for each email address
- Domain-specific language preference settings
- Batch Scripts for massive domain user activations/deactivations
- Operators can now Suspend / Reinstate individual or multiple domains
- Menu driven backup and restore of domain settings

"We take our customer recommendations seriously. They are in the best position to know what they need and want from a Messaging Protection Firewall. Our acclaimed eW@LL Engine and the eW@LL Methodology will not change but the tools to manage them have been honed and will continue to be until we have satisfied every customer's needs. The result of this is the continual improvement of our eW@LL product offerings.", said Sam Huang, Chief Technology Officer, Gennux. "We are focused on taking their recommendations and incorporating them into the eW@LL Suite to make their jobs easier and to provide the reporting and billing information that they require."

The eW@LL Solution is designed to trap Unwanted Messages up-stream, in front of the Service Provider's Messaging Infrastructure and is still controllable by the end user. Each user, whether they are an individual or a staff member within a corporation is provided with the tools to create their own unique preferences for electronic communications. In the past, companies which used content-filtering programs were concerned about the liabilities associated with lost messages. Today, customers who use the eW@LL Solution do not have these concerns because the messages that they want to receive are always delivered. This simple focus of the eW@LL Solution is the reason why customer satisfaction has experienced the greatest increase since Spam made its entry in 1997.

The eW@LL Solution has countered the "Email Dictatorship" which the users have been subjected to with all other server based products and yet provides a user interface which the users are demanding, without compromising the security that the desktop loaded applications lack.

###

About Gennux Microsystems Corp.

Founded in Canada, Gennux, produced and released the eW@LL Solution in response to the demand for a Globally Acceptable set of tools to manage Unwanted Electronic Messages (Spam) for Governments, Telecommunications Service Providers, ISPs, ASP's business and the public. Gennux's vision and mission is to eliminate this menace to our electronic society with the deployment of the eW@LL solution. To date, the success of this objective has surpassed all business forecasts. Our Customers and Partner Companies will soon be present in every city in every country of the world.
