Target new customers with internal network security

PR9.NET November 02, 2005 - Internal network security is the next step after perimetrical security. We all know that internal threats are real and every employee is a potential breach in the network. By authenticating each individual computer user and restricting its access to specific resources, Ultima appliance is proposing a real answer to internal security. Ultima is the leading solution to a strong internal network security, for your corporate site and any remote office through its auto provisioning VPN feature. This innovation, coupled with strong user control, will allow any network to secure confidential traffic in a totally ciphered global network.

After its start in the USA in 2004, Nucleonet is launching distribution partnership in EMEA. We are looking for VARs and Partners to make the enterprise internal networks more secured. Add Ultima product line to your security portfolio is a plus to reach new markets and sign new customers.

Don't hesitate to contact us should you be interested in partnership with Nucleonet or simply enhance your internal network security.

###

About Nucleonet Security Appliances

Nucleonet is the leading provider of enterprise internal networking security solution. Nucleonet's mission is to provide an integrated solution to identify and authenticate users of the local network, control their access to IT resources and cipher their traffic.
