LeadGenerationclub Tells Why Two Sitemaps Are A Must For All Webmasters In Today's Post Google Sitemap's Submission Tool

PR9.NET February 03, 2006 - USA/MSA -- Leadgenerationclub.com today is offering to show all Webmasters who generate sitemaps how to do two sitemaps for their websites in view of Google's new sitemaps submission tool.

Google sitemaps is a service that allows Webmasters to submit an XML map of their site containing information such as change frequency, priority, date created and more. It also hopefully will get your site indexed sooner in Google's search engine. Google suggests their own program to create the site map, but you must have Python in order for it to run since they only accept .xml format.

Now all Webmasters have a choice of an easier way to create these sitemaps, one for Google and one for Yahoo and all other search engine bots using a new software program called SpiderGenerator. SpiderGenerator emulates search bots by following all the links on your site and creating this new site map already formatted in .xml just as Google wants. That's fine for Google. But what about all the other online search engines? They are just too big a slice of the pie to leave behind.

Yahoo, Altavista, MSN, AOL search engines still have spiderbots and are still worthwhile search engines to get listed in. So it's now important that Webmasters have two sitemaps. One for Google in .xml format and one in .html format for all the others. There is however, a little bit of a catch. If you have a .xml format sitemap for Google and googlebot can also read your .html formatted sitemap, it will look at it as two identical pages. Double jeopardy. Not a very good idea. So this is what needs to happen.

You must have two sitemaps, one slightly different than the other.

It need not be an elaborate difference; but different it should be. So what to do?

Use SpiderGenerator to create your .xml sitemap and use the additional .txt sitemap it creates to turn it into a .html format using your favorite html editor.

How many additional links should it have? Up to you. But you only really need one.

Leadgenerationclub.com has prepared two sitemaps as examples that webmasters can take a look at:

Sitemap.xml
<http://leadgenerationclub.com/sitemap.xml>

Sitemap.html
<http://leadgenerationclub.com/sitemapleadgenerationclub.html>

These are very simple sitemaps for a very simple web site, but elaborate sites would have the same requirements.

SpiderGenerator is very fast and easy to use. Webmasters who wish to know how to submit to Google's back door submission program using the Spider program can follow the link that we have posted at our example .html sitemap. That's all their is to it.
