California Software Labs has launched PCMM Gate Control API, a Software Development Kit (SDK) to implement IP based QoS and policy management for multimedia services. The new SDK provides high-level APIs to implement the QoS control components of Application Manager, Policy Server and the CMTS, as specified in CableLabs' PacketCable Multimedia standards.

PR9.NET March 02, 2006 - Pleasanton - California Software Labs has launched PCMM Gate Control API, a Software Development Kit (SDK) to implement IP based QoS and policy management for multimedia services. The new SDK provides high-level APIs to implement the QoS control components of Application Manager, Policy Server and the CMTS, as specified in CableLabs' PacketCable Multimedia standards. This is designed to help combat the challenges faced by service providers by offering guaranteed quality of service (QoS).

PCMM Gate Control API is a developer product meant for equipment vendors and system integrators serving the packet cable networks. This software development kit allows them to develop systems to control QoS (Quality of Service) in the packet cable network. This capability enables delivery of multi-media services like video-on-demand in packet cable networks.

The product supports PacketCable Multimedia Specifications (Sep 2004) from CableLabs® and therefore ensures seamless interfacing with content providers as well as equipment from multiple vendors. With the help of PCMM Gate Control API, service providers can deliver more services as the COPS support makes the CMTS more manageable.

CableLabs and PacketCable are trademarks of Cable Television Laboratories, Inc.
