RSS Replay brings AJAX (Asynchronous JavaScript and XML) together with Dreamweaver to let you put RSS content -- including Podcasts and Photocasts -- into your webpage layouts.

PR9.NET September 06, 2006 - Arlington, VA - RNSoft President & CEO Ronald Northrip today announced the immediate availability of RSS Replay version 1.1.1, a Dreamweaver extension for placing content from RSS feeds into webpage layouts.

RSS Replay uses AJAX (Asynchronous JavaScript and XML) and where needed, ASP or PHP (depending on your website's configuration), to collect RSS content from RSS feeds and applies formatting with Cascading Style Sheets (CSS) that you can control to present that content in the way that best suits your needs.

Does your website have RSS feeds? Want to put them in your webpage layouts? Got a blog? Want to list its entries on other websites you're building? Think another website has really useful articles? Want to put their titles on your webpage? How about company news straight from Google News? Financial content from Yahoo Finance?

All you need to do is republish their RSS Feeds — and RSS Replay lets you do it right from Dreamweaver without retyping or copy/paste and without having to know any new RSS/XML codes.

New in version 1.1.1:

- * Improved CSS style selection control
- * CSS style names validated -- works properly with Dreamweaver 8.0.2 now!
- * Extended browser compatibility and graceful incompatibility
- * Full RSS Format Support: RSS 0.9-2.0 and Atom 0.3-1.0
- * Text Feeds, Podcasts & Photocasts
- * A more complete list of features is available at www.rnsoft.com/en/products/rssreplay/features.php

Get your copy of RSS Replay today and start republishing RSS content tomorrow!
