*The sixth site launched in the "Find..." series, FindTheUKHost.com helps visitors find the best of UK Hosting.*

PR9.NET November 28, 2007 - Thailand - The United Kingdom (UK) has always been at the forefront of technology and this prominence has spread into the field of web hosting. As a result, some of the best of the roughly 40 million Web hosting companies worldwide can be found in the UK. Unfortunately, like every country, the UK also has its core of less professional Web hosts. As a result, in a homogenous environment where products and services are similar, establishing quality UK Web hosting can offer the average hosting user something of a challenge. Luckily, November sees the launch of a new Web site to help consumers find the best UK hosting possible - FindTheUKHost.com.

"People choose hosting in the UK for a variety of reasons," explained Anne Wongsawat, Web Editor of the new site. "Although Web hosting is international, and you can essentially host a Web site anywhere, there is a core domestic UK market which prefers to deal with a host that is geographically accessible and who you can pay in Sterling (UK currency). The opposite is also true – because of the borderless nature of Web hosting, people host with UK hosts simply because hosts there meet their technical and cost requirements. For them, the fact they are hosting with a UK company is inconsequential. There are also those who deliberately host in the UK because servers there are connected to backbones physically located closer to their target audience – perhaps in the UK or Europe – and they want faster loading times. Whatever reason people host in the UK, they want a reliable, cost-effective provider. FindTheUKHost.com will certainly make researching UK hosting companies easier."

FindTheUKHost.com offers a comprehensive listing of companies in the UK Web hosting industry. Like the other sites in the "Find..." series, the site provides a number of search tools. Users can search through shared, dedicated and reseller hosting options at prices ranging from less than \$500 per month to less than \$10 per month. The tools generate the details of hosts that meet a user's requirements, providing information on a host's plans and prices, a link to the host's Web site alongside a snapshot, and contact details including an email link. After finding the information required, a user can contact a company directly to pursue an enquiry and ultimately purchase a package. The site also allows users to search for UK Web hosts offering options by name, and offers access to a number of 'Hot Deals' – hosting packages at discount prices or with benefits. The latest Web hosting news is available, as are articles covering a range of Web hosting topics. Most importantly, the site provides access to the comments of end users.

"With the vast wealth of Web hosting capability coupled with the differences in performance available in the UK, finding out the most you can about a company before buying a package is an absolute necessity," added Ms. Wongsawat. "This is where our 'comments' and 'ratings' function adds genuine value to our users. Real users provide comments and ratings - people who have experienced a company and know whether they provide a quality product and service. This sort of intelligence is vital, and I am confident that FindTheUKHost.com will provide a valuable service to people researching the UK Web hosting market."
