Capsa 6.7, a Windows packet and protocol analyzer that makes it easy to locate and troubleshoot network problems was newly released by Colasoft. More than 300 protocols are now supported.

PR9.NET March 17, 2008 - Chengdu, China - Colasoft has released Capsa 6.7, a Windows packet and protocol analyzer that makes it easy to locate and troubleshoot network problems. The latest version adds 12 new network-layer protocols and 98 new application-layer protocols, for a total of more than 300 protocols. Moreover, 6 new protocols including GGP, ISMP, IGRP, EIGRP, CDP, and CGMP can now be decoded.

Capsa performs real-time packet capturing, 24/7 network monitoring, advanced protocol analyzing, in-depth packet decoding, and automatic expert diagnosing. By giving you insights into all of your network's operations, Capsa makes it easy to isolate and solve network problems, identify network bottleneck and bandwidth use, and detect network vulnerabilities, external attacks and insecure applications.

Network administrators can directly monitor http requests, email messages, DNS queries, as well as real-time activities and message details for the four most popular instant messengers: MSN, AIM, ICQ, and Yahoo Messenger.

Capsa is designed to be used by both IT professionals and novice users. Problems are clearly identified, and solutions are suggested in understandable terms. The program includes tables and graphs, as well as intuitive statistics and reports. Capsa has the tools that you would expect to find in a high-end protocol analyzer, including tools to create and replay packets, and ping and scan IPs and MACs across the LAN.

What separates Colasoft Capsa from other network sniffers is its unique ability to conduct quick drilldown analysis on a single workstation, protocol or packet. After locating a single item, it allows you to get comprehensive and dedicated information about that item.

Whether you're a network administrator who needs to identify, diagnose, and solve network problems quickly, an IT professional who wants to monitor user activities on the network, a security manager who needs to ensure that the corporation's communications assets are safe, or a consultant who has to quickly solve network problems for clients, Capsa has the tools that you need.

Capsa 6.7 runs under Windows 2000/XP/2003/Vista. You can download a trial version of Capsa from the company's web site: <http://www.colasoft.com/>.

###

About Colasoft. Co., Ltd

Since 2001, Colasoft has been developing and marketing software to perform network failure diagnosis, network security evaluation, network performance optimization, and network management. In addition to Capsa, the company also offers: Colasoft MSN Monitor, a highly accurate MSN monitoring tool that identifies and monitors MSN communications in the network; and Colasoft EtherLook, a powerful application that monitors and analyzes network traffic, allowing you to manage your network efficiently. The company also offers four free network utilities: Colasoft Packet Builder, Colasoft Packet Player, Colasoft MAC Scanner, and Colasoft Ping Tool.
